Orpheus Silica Based Sorbents

Solid Phase extraction is a technique to clean, separate and concentrate analytes prior to analysis. Solid Phase Extraction involves passing sample through a sorbent bed that preferentially retains the analyte under the right conditions.

Nonspecifically bound moieties are washed off the packed bed and the analyte is eluted in solvent. This increased analyte concentration allows easier detection and rapid analysis.

Orochem silica based Orpheus sorbents are custom bonded in-house to standard or custom specifications. Most commonly they include irregular shaped 50 micron particles with 60 ! pore sizes for sample preparation.

Oro-Sep Cartridges

Oro-Sep cartridges are molded from medical grade virgin polypropylene, fritted with 20 micron PE frits and are compatible with a syringe or a vacuum manifold. The female luer tip inlet of the cartridge allows connection to a syringe tip. The male luer tip outlet connects to a

vacuum manifold. Sep-Pak® cartridges may be substituted with Oro Sep cartridges. Oro-Sep cartridges packed with reversed phases, normal phases, and ion exchange phases in three different bed sizes, may be utilized for sample preparation and sample concentration in the bio-tech, clinical, environmental, forensic, and pharmaceutical arena.

Solid Phase Extraction Plates - 2.2mL/Well Volume

OROCHEM 2000 SPE 96-well plates are packed with Orpheus silica based sorbents that have broad selectivity and resist occlusion by proteinaceous materials from samples. Non-occlusion of sorbents, combination of size exclusion and adsorption chromatography allows efficient flow characteristics, enhanced detection, and cleaner extracts. The 2.2 mL/well SPE plates manufactured from virgin medical grade polypropylene have the SBS standard footprint. Individually fritted wells eliminate cross-talk, the larger exit diameter of the well enables a faster flow rate. The OROCHEM 2000 Vacuum Manifold is designed to accommodate every filter plate, and comes with inserts to accommodate collection plates of all sizes, including shallow well plates.

Applications:

Sample preparation by solid phase extraction in drug development, drug analysis, pharmacokinetics, and biotechnological applications.

Polymeric SPE and Aquamatrix Columns and Plates

Celerity Polymeric SPE Columns

The Celerity series of polymeric resin particles have a large surface area, are highly rigid and are stable over pH range 1 to 14. Available in hydrophilic and hydrophobic forms and as ion exchangers, they are recommended when advanced detection methods are utilized in conjunction with unique selectivity of a polymer.

Aquamatrix: Supported Liquid-Liquid Extraction

- Packed with chemically inert material, stable in the pH range 1-13
- Compatible with robotic liquid handlers for automated extraction
- Allows high throughput alternative to traditional liquid-liquid extraction techniques
- Eliminates steps like mixing, centrifugation and organic phase separation
- Provides support, greater surface area and accelerated solvent extraction
- Aquamatrix plates are 96 well plates in 1mL or 2mL formats packed with flux calcined diatomaceous earth for a high capacity retention of analytes.

Recommended Protocol

- A mixture of sample (e.g., plasma), internal standard, and buffer solution to adjust pH is prepared.
- This aqueous mixture is then added to the dry particle bed (no conditioning or pretreatment of the bed is necessary). The mixture is allowed to partition for about 3-5 minutes on the particle surface under gravity flow.
- The analyte in aqueous solution is now spread out among the particles and occupies a high surface area. A hydrophobic filter on the bottom of each well prevents the aqueous phase from breaking through into the collection vessel placed underneath. Organic solvent is then added to the wells.
- The analyte will partition from the adsorbed aqueous phase into the organic solvent as this solvent slowly flows through the particle bed under gravity.
- The organic eluate is collected in wells or tubes underneath the tips of the plate. A second addition of organic solvent is performed and the combined eluates are evaporated to dryness. The residue is reconstituted in a mobile phase compatible solution and an aliquot is injected into the chromatographic system for analysis.

Aquamatrix columns are a good alternative to ToxElute, ChemElute.

Disc-Solid Phase Extraction Columns and Plates

Disc-Solid Phase Extraction Columns

SuPErScreen is a proprietary high capacity silica particle embedded in glass fiber for Disc Solid Phase Extraction. Elimination of sorbent fines and decreased sample elution columns provide cleaner extracts which allows you to bypass evaporation prior to detection. SuPErScreen Silica impregnated glass fiber discs are manufactured using both long

and short glass fibers offering greater porosity of the matrix. With silica particles present as an integral component during manufacturing, uniform distribution of silica is achieved across the thickness of the disc membrane. With SuPErScreen disc SPE, an 8mm diameter disc allows 13.8mg and a 96-well (6mm disc) format allows 7.6mg/well media loading capacity.

Applications:

Sample preparation by Solid Phase Extraction in drug development, drug analysis, pharmacokinetics, and biotechnological applications.

Reversed Phase Disc-Solid Phase Extraction Cartridges

Cat. No.	Phase	Volume	Qty.	Price
OC-1102	C2 Disc	1mL	100

20 Position Vacuum Manifold

• Wide port spacing for large tubes

Multiple sample processing with the 20 position manifold consists of a clear glass chamber and lid, to which a vacuum is applied to draw solvents and sample through an SPE column, cartridge, or disk.

Polypropylene top with female luer inlets and male luer outlets. Adjustable racks in the glass chamber will accommodate a variety of sample collection vessels. 19mm plates are included. Eluants are deposited directly into the collection vessel of choice via optional polypropylene, or SS needles.

Dimensions: 18" (L) x 4" (W) x 7.3" (D).

20 Port Manifold

Cat. No.	Description	Qty.
OVM2020	20 Port vacuum manifold	1
OVM2025	Polypropylene needles	20
OVM2026	SS needles	20
OVM2023	Gaskets	2
OVM2028	Plate, 13mm	1
OVM2029	Plate, 16mm	1
OVM2030	Plate for volumetric flasks	1
